

WHAT IS CLAIMED IS:

1. An automatic image retrieval system comprising
a plurality of picture information such as a zoom picture and an overhead picture such as of a player in a sport game, a step of encoding them for transfer, and a picture server for storing the digitized picture data by using a net line, and

a step of performing time-dependent inputs such as of the player's behavior and other information and transferring data thereof, and a data server for storing real-time data to be transferred by using the net line, wherein

a user (viewer) makes an access to either or both of the picture server and the data server on the net, and has a predetermined picture linked with a data to be output on an identical frame.
